A photograph of a large black tractor with a front loader, driving through a field of tall grass and crops. The tractor is kicking up a cloud of dust or dirt. The background shows a line of trees under a hazy, golden sky, suggesting a sunrise or sunset.

Enhancing Repository Integration with Crossref Services

Johanssen Odhiambo Obanda
Community Engagement Manager, Crossref

Presented by Amanda French
ROR Technical Community Manager, Crossref

What we will cover today:

- Introduction to Crossref API and its capabilities
- How repositories can use the API to query
- Workflows for metadata enrichment
- Benefits for repository managers, researchers, and funders
- Metadata schema updates

What is metadata?

"Metadata is communication.

It describes and identifies an item, it defines relationships, it sets parameters for the range of actions something can engage in.

As the things we read, write, create, use, move around, and engage with become more digital, metadata becomes more important, because without metadata, all that movement, interaction, and discovery, could not happen."

- Juliane Schneider, Metadata 20/20

<https://metadata2020.org/blog/2017-09-14-metadata-and-communication>

Why does metadata matter?

Research integrity

Metadata as signals of trustworthiness including provenance information

+

Reproducibility

Metadata as relationships between literature, data, software, protocols and more

Assessment

Metadata can be used to analyze the outcomes of research and demonstrate compliance

Discoverability

More metadata means more systems have more pathways to find your work

Crossref REST API

<https://search.crossref.org/>

Metadata Search Funding Data Link References Status API Help  Sign in

Search the metadata
of journal articles, books, standards,
datasets & more

 Title, author, DOI, ORCID iD, etc.

Crossref
CELEBRATING 25 YEARS

We make metadata open via the REST API

A software intermediary that allows two applications to talk to each other.

We make metadata open via the REST API

A software intermediary that allows two applications to talk to each other.

Crossref
Metadata APIs

We make metadata open via the **REST API**

<https://api.crossref.org/>

REST... API?

Communication between Client and Server

Information is organized into Unique Resource Identifiers (e.g. URL)

Unique addresses that identify and locate a resource

All requests from the client to the server must contain all of the information necessary to understand and complete the request

We won't login to a portal to get the data, there are no stored sessions

Three basic elements

<https://api.crossref.org/works?filter=from-pub-date:2025&rows=0>

Server

Endpoints

?Parameters

Who is
providing
the data?

Digital locations where
an API receives
requests about specific
resources

They determine the type
of action you want to
take on the resource

Funders

Endpoints that expose funder related data

GET /funders/{id}/works

GET /funders/{id}

GET /funders

Journals

Endpoints that expose journal related data

GET /journals

GET /journals/{issn}

GET /journals/{issn}/works

Works

Endpoints that expose works related data

GET /works/{doi}

GET /works

GET /works/{doi}/agency

Prefixes

Endpoints that expose prefix related data

GET /prefixes/{prefix}/works

GET /prefixes/{prefix}

Members

Endpoints that expose member related data

GET /members/{id}/works

GET /members/{id}

GET /members

Types

Endpoints that expose type related data

GET /types/{id}

GET /types

GET /types/{id}/works

How does this operation look like?

1. <https://api.crossref.org/types>
2. Let's paste this into our web browser
3. We should get a result like this

```
JSON    Raw Data    Headers
Save Copy Collapse All Expand All Filter JSON

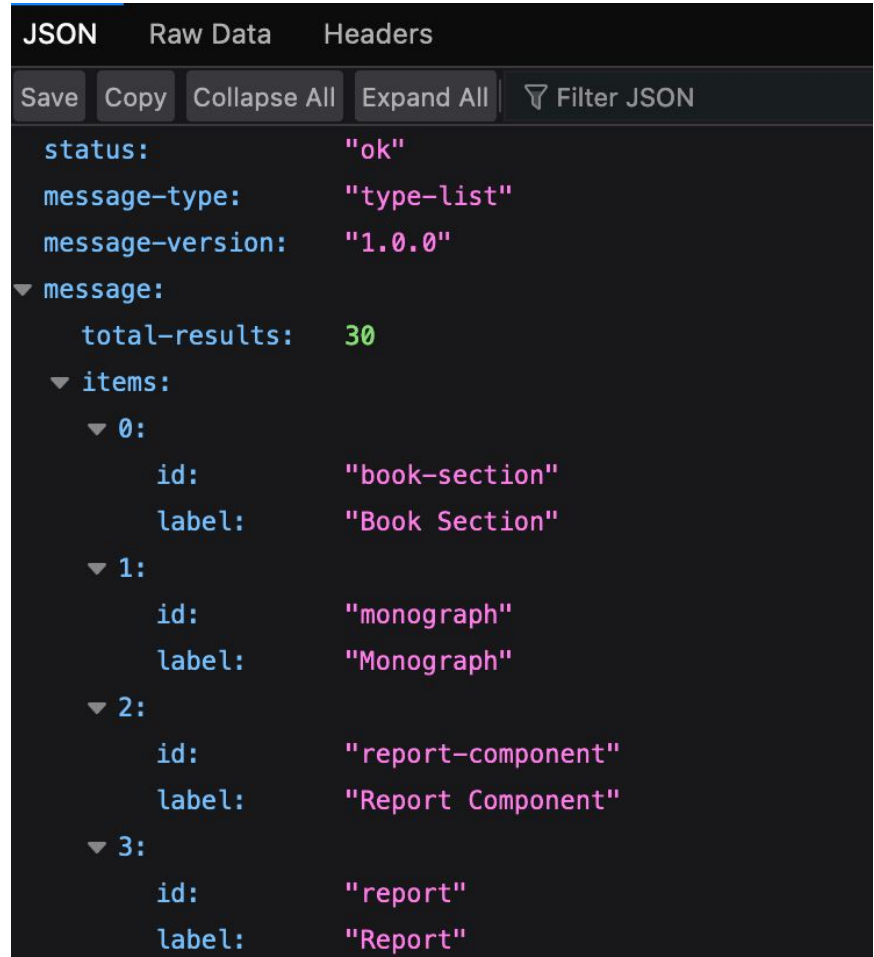

{
  "status": "ok",
  "message-type": "type-list",
  "message-version": "1.0.0",
  "message": {
    "total-results": 30,
    "items": [
      {
        "id": "book-section",
        "label": "Book Section"
      },
      {
        "id": "monograph",
        "label": "Monograph"
      },
      {
        "id": "report-component",
        "label": "Report Component"
      },
      {
        "id": "report",
        "label": "Report"
      },
      {
        "id": "peer-review",
        "label": "Peer Review"
      },
      {
        "id": "book-track",
        "label": "Book Track"
      },
      {
        "id": "journal-article",
        "label": "Journal Article"
      },
      {
        "id": "book-part",
        "label": "Part"
      },
      {
        "id": "other",
        "label": "Other"
      }
    ]
  }
}
```

JSON format

Standard for machine data exchange

Key: value

Also nested and/or lists of Key: value

The screenshot shows a JSON viewer interface with a dark theme. At the top, there are tabs for 'JSON' (selected), 'Raw Data', and 'Headers'. Below the tabs is a toolbar with buttons for 'Save', 'Copy', 'Collapse All', 'Expand All', and a 'Filter JSON' button with a funnel icon. The main area displays a JSON object with the following structure:

```
{  "status": "ok",  "message-type": "type-list",  "message-version": "1.0.0",  "message": {    "total-results": 30,    "items": [      {        "id": "book-section",        "label": "Book Section"      },      {        "id": "monograph",        "label": "Monograph"      },      {        "id": "report-component",        "label": "Report Component"      },      {        "id": "report",        "label": "Report"      }    ]  }  }
```

The JSON is color-coded: keys are blue, string values are pink, and the number 30 is green. The 'message' object is expanded, and its 'items' array is also expanded, showing four objects with 'id' and 'label' properties.

From JSON to a table

https://labs-toolkit.fly.dev/?tool_name=api_query_url_download_tool

API Query URL Download tool

Add your own API links below to retrieve results from the API

Add the URL here

Example link in the help section ?

Run API Query

Multiple pools

You have three access levels to the API metadata:

- Public. Free, fully anonymous.
- Polite. Free, you provide your email (recommended).¹
 - We only use this information to contact you in case of issues.
 - Include 'mailto' field in your API query.
- Plus. Premium service, you get:
 - A service level agreement guaranteeing you extra service and support, giving you a consistent and predictable experience.
 - Additional features such as snapshots and priority service/rate limits.

¹ We get rid of your information after 90 days.

Guidance for every level

BEGINNING?

You've heard Crossref metadata might be useful and want to know where to start.

EXPLORING?

You have some specific queries and want a lightweight way to use Crossref metadata.

INTEGRATING?

You rely on Crossref metadata and need to incorporate it into your product at scale.

How repositories can utilize Crossref metadata

How repositories can utilize Crossref metadata

- Enrich Records with Quality Metadata
 - Auto-populate records via Crossref's REST API
 - Pull titles, authors, funders, ORCID iDs, licenses, and more
- Persistent linking
 - Use DOIs to link to published content
 - Create connections between articles, datasets, and software
- Align with FAIR Principles
 - DOIs & metadata indexed for discovery
 - DOIs resolve to landing pages persistently
 - Open standards (XML, JSON, ORCID, ROR)
 - Licensing & funding info clarify reuse

Crossref services that support repositories

- Reference linking
 - enables researchers to follow a link from the reference list to other publications, helping them to make connections and discover new things.
- Cited-by
 - shows how research has been received by the community by displaying the number of times it has been cited, and by linking to the citing content
- Similarity Check
 - Enables editors to assess the originality of the work before they publish it
- Crossmark
 - The Crossmark button gives readers quick and easy access to the current status of an item of content, including any corrections, retractions, or updates to that record.

Metadata updates

ROR can now be supplied as a funder identifier

Grants schema 0.2.0:

- new funding types: APC, BPC, infrastructure

5.4 update:

- publication types for citations
- status support for preprints
- version metadata

Typed citations

Can include a 'type' with citations supplied with metadata records

Types are:

| | | |
|-----------------------|-----------------|-------------------|
| blog | dissertation | preprint |
| blog post | journal | protocol |
| book | journal article | registered report |
| book chapter | other | report |
| collection | patent | software |
| conference paper | peer review | standard |
| conference proceeding | poster | web resource |
| dataset | | |

Why it matters - for you and the community

- For repository managers - better record quality and linking
- For researchers - increased discoverability and citation tracking
- For funders - clearer funding links and impact visibility
- Alignment with FAIR and open science goals
